

Session 1 — Demo: Follow-Along Steps

BFL Loan Document Archive

Participant Reference — steps only

Use the **trainee_** prefix for every resource you create.

1. Open Cloud Shell

portal.azure.com → Cloud Shell icon → Bash

2. Confirm active subscription

```
az account show --output table
```

3. Create the Resource Group

```
az group create \  
  --name trainee_rg_docarchive \  
  --location eastus \  
  --tags Environment=Training Owner=<your-name> CostCenter=BFL-Training  
AutoDestroy=Yes
```

4. Create the Storage Account

```
az storage account create \  
  --name traineestdocarchive \  
  --resource-group trainee_rg_docarchive \  
  --location eastus \  
  --sku Standard_ZRS \  
  --kind StorageV2 \  
  --access-tier Hot
```

(Replace *traineestdocarchive* with a globally unique name if it's already taken — e.g. add your initials or a number.)

5. Create the Blob container

```
az storage container create \  
  --account-name traineestdocarchive \  
  --name loan-documents \  
  --auth-mode login
```

6. Create the Virtual Machine

```
az vm create \  
  --resource-group trainee_rg_docarchive \  
  --name trainee_vm_docprocessor \  
  --image Ubuntu2204 \  
  --size Standard_B1s \  
  --zone 1 \  
  --admin-username azureuser \  
  --generate-ssh-keys \  
  --tags Environment=Training Owner=<your-name> CostCenter=BFL-Training  
AutoDestroy=Yes
```

7. Apply a Resource Lock to the Storage Account

```
az lock create \  
  --name protect-docarchive-storage \  
  --resource-group trainee_rg_docarchive \  
  --resource traineestdocarchive
```

```
--resource-name traineestdocarchive \  
--resource-type Microsoft.Storage/storageAccounts \  
--lock-type CanNotDelete
```

8. Verify in the Portal

- Resource Groups → **trainee_rg_docarchive** → confirm Storage Account + VM are listed
- Resource Graph Explorer → run:

```
Resources  
| where resourceGroup == "trainee_rg_docarchive"  
| project name, type, location, tags
```

- Cost Management + Billing → Cost analysis → filter by **trainee_rg_docarchive**

9. Clean up

```
az lock delete \  
  --name protect-docarchive-storage \  
  --resource-group trainee_rg_docarchive \  
  --resource-name traineestdocarchive \  
  --resource-type Microsoft.Storage/storageAccounts  
  
az group delete --name trainee_rg_docarchive --yes --no-wait
```
